

A200 Installation Instruction

1: Install the two legs and the crossbeam, paying attention to the front and back positions (the shorter leg is in the front. The seat iron plate on the crossbeam: the higher end is in the front).

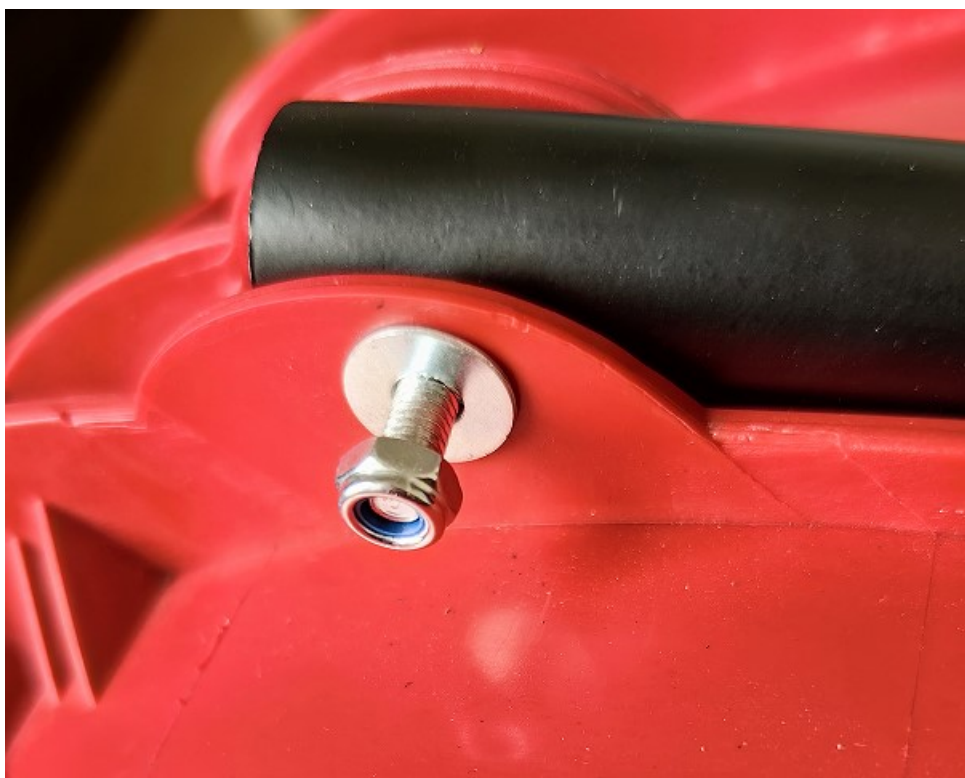

During installation, pay attention to the small square iron pieces at both ends of the crossbeam, which must be stuck into the pipe openings of the moving legs to ensure stability (the small square pieces serve as positioning).

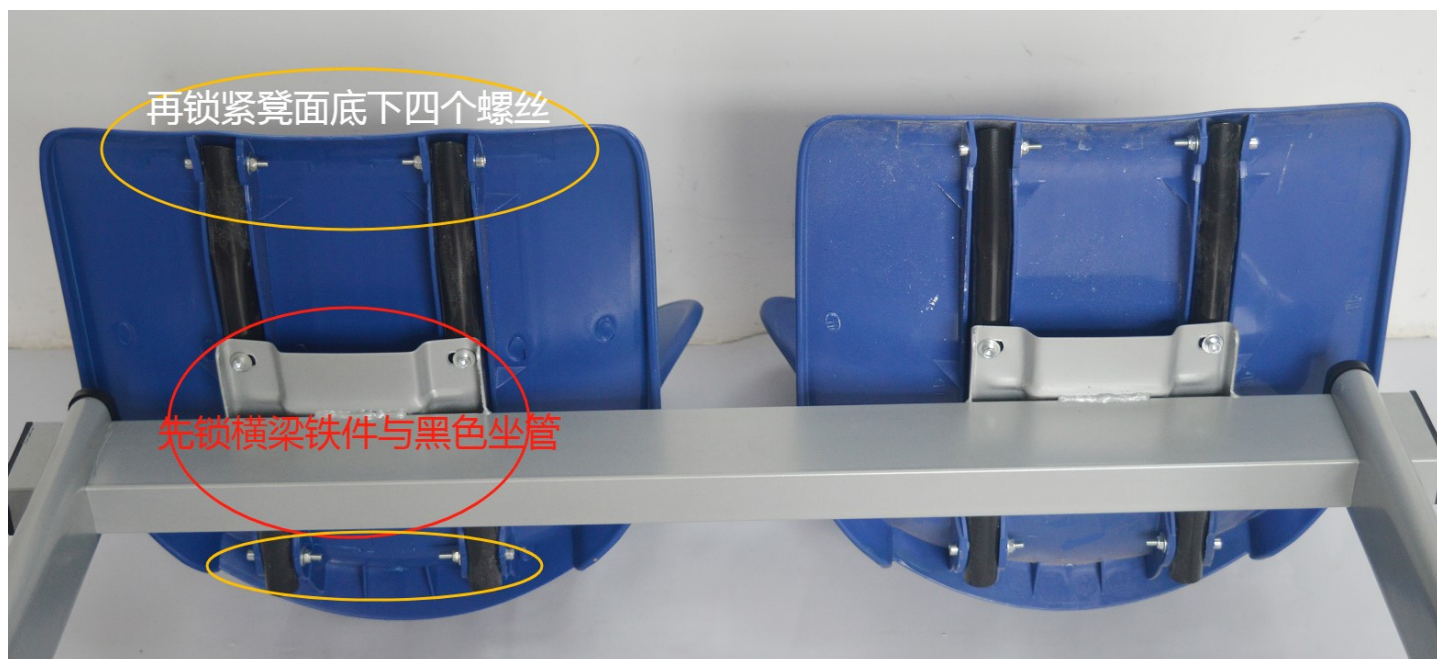

2. Install the two black bows (black long tubes) under the seat surface. Note that the screws shall not be tightened at this time (if they are tightened, the black tubes will not be able to moving when they are installed on the crossbeam later).

The nut is self-locking and the end with blue glue is facing outwards.

3: Install the chair to the crossbeam. Firstly locking crossbeam iron plate and black seat tubes.

After locking the four screws at the bottom of the iron plate, tighten the four self-locking nuts on the black pipe (make sure to lock them in place, otherwise they will loosen and make strange noises when you sit down)
